

**MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION**  
(Autonomous)  
(ISO/IEC - 27001 - 2005 Certified)

**WINTER – 2023 EXAMINATION**  
**MODEL ANSWER**

**Subject: Data Communication & Computer Network**

**Subject Code: 22414**

**Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for anyequivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students in first year (first and second semesters) write answers in Marathi or bilingual language (English +Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

Q. No	Sub Q.N.	Answer	Marking Scheme
1.	a) Ans.	<b>Attempt any <u>FIVE</u> of the following:</b> <b>List advantages of Computer Network ( any two)</b> 1. Convenient resource sharing 2. Connectivity 3. Security 4. Easy File/Data Sharing 5. Highly Flexible 6. Reduced cost 7. Great storage capacity	<b>10</b> <b>2M</b>  <i>Any two advantages</i> <i>1M each</i>

**MODEL ANSWER**

**Subject: Data Communication & Computer Network**

**Subject Code: 22414**

2.	a) Ans.	Attempt any <u>THREE</u> of the following: Compare client server and peer to peer networks			12 4M Any four points 1M each
		Basis of Comparison	Client-Server Network	Peer-to-Peer Network	
		Basic	In a client-server network, certain computers act as server and other act as clients.	In a peer-to-peer network, every node act as a client and server.	
		Expense	A Client-Server network is more expensive to implement.	A Peer-to-Peer is less expensive to implement.	
		Stability	It is more stable and scalable than a peer-to-peer network.	It is less stable and scalable, if the number of peers increases in the system.	
		Data	In a client-server network, the data is stored in a centralized server.	In a peer-to-peer network, each peer has its own data.	
		Server	A server may get overloaded when many clients make simultaneous service requests.	A server is not bottlenecked since the services are dispersed among numerous servers using a peer-to-peer network.	
		Focus	Sharing the information.	Connectivity.	
		Service	The server provides the requested service in response to the client's request.	Each node has the ability to both request and delivers services.	
		Performance	Because the server does the bulk of the work, performance is unaffected by the growth of clients.	Because resources are shared in a big peer-to-peer network, performance will likely to suffer.	
		Security	A Client-Server network is a secured network because the server can verify a client's access to any area of the network, making it secure.	The network's security deteriorates, and its susceptibility grows as the number of peers rises.

**WINTER – 2023 EXAMINATION**  
**MODEL ANSWER**

**Subject: Data Communication & Computer Network**

**Subject Code:** 22414

	<p><b>Physical Layer:</b> OSI Model, Layer 1 conveys the bit stream - electrical impulse, light or radio signal — through the network at the electrical and mechanical level. It provides the hardware means of sending and receiving data on a carrier, including defining cables, cards and physical aspects.</p> <p><b>Data Link Layer:</b> At OSI Model, Layer 2, data packets are encoded and decoded into bits. It furnishes transmission protocol knowledge and management and handles errors in the physical layer, flow control and frame synchronization..</p> <p><b>Network Layer: Layer 3</b> provides switching and routing technologies, creating logical paths, known as virtual circuits, for transmitting data from node to node. Routing and forwarding are functions of this layer, as well as addressing, internetworking, error handling, congestion control and packet sequencing.</p> <p><b>Transport Layer:</b> This Layer, provides transparent transfer of data between end systems, or hosts, and is responsible for end-to-end error recovery and flow control. It ensures complete data transfer from source to destination.</p> <p><b>Session Layer:</b> This layer establishes, manages and terminates connections between applications. The session layer sets up, coordinates, and terminates conversations, exchanges, and dialogues between the applications at each end. It deals with session and connection coordination</p> <p><b>Presentation Layer:</b> This layer provides independence from differences in data representation (e.g., encryption) by translating from application to network format, and vice versa. The presentation layer works to transform data into the form that the application layer can accept. This layer formats and encrypts data to be sent across a network, providing freedom from compatibility problems. It is sometimes called the syntax &amp; semantics.</p> <p><b>Application Layer:</b> This Layer, supports application and end-user processes. Everything at this layer is application-specific. This layer provides application services for file</p>

(Autonomous)  
(ISO/IEC - 27001 - 2005 Certified)

**WINTER – 2023 EXAMINATION**  
**MODEL ANSWER**

**Subject: Data Communication & Computer Network**

**Subject Code: 22414**

**Class B :**

Class B IP address format is given below:

1	2	3	4	5	6	7	8	2 <sup>nd</sup> Byte	3 <sup>rd</sup> Byte	4 <sup>th</sup> Byte
1	0	Network ID						Network ID	Host ID	Host ID

In this, the first two bits are '1 0'. The next 14 bits are used indicate network id. Rest of the 2 bytes are used to indicate host id. Thus, the first byte of class B type of IP address has a range from 128 to 191.

Example : 187.4.5.1

In this address, the first byte '187' has first two bits as 10.

**Class C :**

Class C IP address format is given below:

1	2	3	4	5	6	7	8	2 <sup>nd</sup> Byte	3 <sup>rd</sup> Byte	4 <sup>th</sup> Byte
1	1	0	Network ID					Network ID	Network ID	Host ID

In this, the first three bits are '1 1 0'. The next 21 bits are used indicate network id. Rest of the One byte is used to indicate host id. Thus the first byte of the IP address in class C has range from 192 to 223.

Example : 192.168.1.2

In this the first three bits are 110, which represents the Class C type IP address.

**Class D:**

Class D IP address format is given below:

1	2	3	4	5	6	7	8	2 <sup>nd</sup> Byte	3 <sup>rd</sup> Byte	4 <sup>th</sup> Byte
1	1	1	0	Multicast Address						

If first 4 bits are '1 1 1 0' the IP address belongs to class D. The IPv4 networking standard defines Class D addresses as reserved for multicast. Multicast is a mechanism for defining groups of nodes and sending IP messages to that group rather than to every node on the

**MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION**

**Subject Code: 22414**

		<p>LAN (broadcast) or just one other node (unicast). Multicast is mainly used on research networks. As with Class E, Class D addresses should not be used by ordinary nodes on the Internet. The range for first byte of class D starts from 224 till 239.</p> <p>Example: 225.25.2.1</p> <p>Here, the first 4 bits are 1110</p> <p><b>Class E:</b></p> <p>Class E IP address format is given below:</p> <table><tr><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>2<sup>nd</sup> Byte</td><td>3<sup>rd</sup> Byte</td><td>4<sup>th</sup> Byte</td></tr><tr><td>1</td><td>1</td><td>1</td><td>1</td><td>0</td><td colspan="6">Reserved for future use</td></tr></table> <p>If first 5 bits are ‘1 1 1 1 0’ the IP address belongs to class E. For class E minimum value for reserved address is 240.0.0.0 to 255.255.255.255. These are used for research work in IP addresses.</p> <p>Example: 245.5.6.2 Here, the first 5 bits are 11110.</p>	1	2	3	4	5	6	7	8	2 <sup>nd</sup> Byte	3 <sup>rd</sup> Byte	4 <sup>th</sup> Byte	1	1	1	1	0	Reserved for future use						
1	2	3	4	5	6	7	8	2 <sup>nd</sup> Byte	3 <sup>rd</sup> Byte	4 <sup>th</sup> Byte															
1	1	1	1	0	Reserved for future use																				
	<p><b>c)</b></p> <p><b>Ans.</b></p>	<p><b>Describe multiplexing techniques</b></p> <p>Multiplexing is a technique by which different analog and digital streams of transmission can be simultaneously processed over a shared link. Multiplexing divides the high capacity medium into low-capacity logical medium which is then shared by different streams. Communication is possible over the air (radio frequency), using a physical media (cable), and light (optical fiber). All mediums are capable of multiplexing. When multiple senders try to send over a single medium, a device called Multiplexer divides the physical channel and allocates one to each. On the other end of communication, a De-multiplexer receives data from a single medium, identifies each, and sends to different receivers.</p> <p>Different multiplexing techniques are</p> <ol style="list-style-type: none"><li>1. Frequency Division multiplexing</li><li>2. Time division multiplexing</li></ol>	<p><b>4M</b></p> <p><i>Explanation of multiplexing-2M</i></p> <p><i>Each technique 1M each</i></p>																						

WINTER – 2023 EXAMINATION  
MODEL ANSWER

Subject: Data Communication & Computer Network

Subject Code: 22414

**Frequency Division Multiplexing:** When the carrier is frequency, FDM is used. FDM is an analog technology. FDM divides the spectrum or carrier bandwidth in logical channels and allocates one user to each channel. Each user can use the channel frequency independently and has exclusive access of it. All channels are divided in such a way that they do not overlap with each other. Channels are separated by guard bands. Guard band is a frequency which is not used by either channel.

**Time Division Multiplexing:** TDM is applied primarily on digital signals but can be applied on analog signals as well. In TDM the shared channel is divided among its user by means of time slot. Each user can transmit data within the provided time slot only. Digital signals are divided in frames, equivalent to time slot i.e. frame of an optimal size which can be transmitted in given time slot.

When channel A transmits its frame at one end, the De-multiplexer provides media to channel A on the other end. As soon as the channel A's time slot expires, this side switches to channel B. On the other end, the De-multiplexer works in a synchronized manner and provides media to channel B. Signals from different channels travel the path in interleaved manner.

WINTER – 2023 EXAMINATION  
MODEL ANSWER

Subject: Data Communication & Computer Network

Subject Code: 22414

OR

**Advantages of WAN**

- **Large area coverage:** WAN covers a large geographical area (1000 km or more than).
- **Higher bandwidth:** WAN networks usually cover large geographical areas.
- **Centralized data:** Using the WAN network you can share the data connected to all the devices in the respective network.

• **Disadvantages of WAN**

- **Security issue:** WAN faces more security problems than LAN and MAN networks since many technologies are merged in WAN networks. It can open a security gap, which paves the way of occurring malicious attacks and identity intruders.
- **Installation cost:** WANs are default complex and complicated because of large geographical area coverage. Hence there is a set-up cost in expensive WAN that also needs routers, switches, and other security solutions.
- **Troubleshooting issues:** Troubleshoot the big challenge on the WAN network and it requires more time. If any issue occurs in the computer network then it is the most difficult part to find out the proper cause due to their broad coverage area.
- **Maintenance issues:** In a WAN network, it is difficult to maintain the network especially a data center that operates 24/7 is the biggest challenge out of all. Here 24/7 needs assistance from network administrators and technicians. In a WAN, maintenance cost is high.

**SUMMER – 2023 EXAMINATION**  
**Model Answer – Only for the Use of RAC Assessors**

**Subject Name: Data Communication and Computer Network**

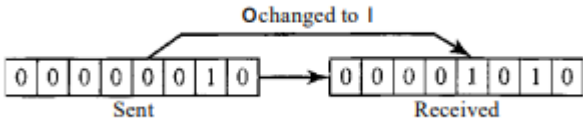

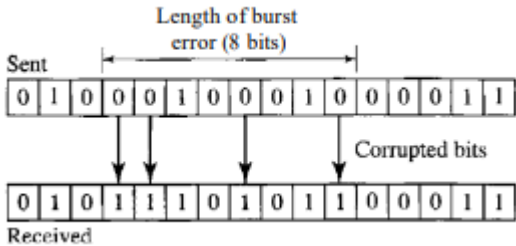

**Subject Code: 22414**

**Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students in first year (first and second semesters) write answers in Marathi or bilingual language (English +Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

Q. No.	Sub Q. N.	Answer	Marking Scheme
1		<b>Attempt any <u>FIVE</u> of the following:</b>	<b>10 M</b>
	a)	<b>Define computer Network.</b>	<b>2 M</b>
	<b>Ans</b>	Computer networking refers to interconnected computing devices that can exchange data and share resources with each other. A network connection between these devices can be established using cable or wireless media.	Correct definition 2 M (other definition of computer network can be considered)
	b)	<b>Describe data communication standards.</b>	<b>2 M</b>
	<b>Ans</b>	Standards provide guidelines to manufacturers, vendors, government agencies, and other service providers to ensure the kind of interconnectivity necessary in today's marketplace and in international communications.  <b>De Facto Standard :</b> The meaning of the word " De Facto " is " By Fact " or "By Convention". These standards have not been approved by any Organization, but have been adopted as Standards because of its widespread use. In addition, sometimes Manufacturers often establish these standards. <b>For example:</b> Apple and Google are two companies, which established their own	1 M for De Facto Standard and 1 M for De Jure Standard

		rules on their products, which are different. In addition, they use some same standard rules for manufacturing for their products. <b>De Jure Standard:</b> The meaning of the word “ <i>De Jure</i> ” is “By Law” or “By Regulations”. Thus, these standards have been approved by officially recognized body like ANSI, ISO, and IEEE etc. These are the standard, which are important to follow if it is required or needed. <b>For example :</b> All the data communication standard protocols like SMTP , TCP , IP , UDP etc. are important to follow the same when we needed them.	
	c)	<b>State any two types of unguided media.</b>	<b>2 M</b>
	Ans	1) Radio wave 2) Infrared 3) Microwave	Any 2 types 2 M
	d)	<b>State any two limitations in Bluetooth</b>	<b>2 M</b>
	Ans	It has low bandwidth as compared to Wi-Fi. It allows only short range communication between devices. Security is a very key aspect as it can be hacked.	Any 2 correct limitations 2 M
	e)	<b>Describe single Bit error and Burst error.</b>	<b>2 M</b>
	Ans	<b>Single-Bit Error :</b> The term single-bit error means that only 1 bit of a given data unit (such as a byte, character, or packet) is changed from 1 to 0 or from 0 to 1.  <p>Fig: Single bit error</p> <b>Burst Error:</b> The term burst error means that 2 or more bits in the data unit have changed from 1 to 0 or from 0 to 1.  <p>Fig: Burst Error</p>	1 M for single bit and 1 M for Burst error
	f)	<b>List any four Network connecting devices.</b>	<b>2 M</b>
	Ans	1) Hub                      2) Switch                      3) Router                      4) Bridge	Any 4 devices

		5) Gateway      6) Modem      7) Repeater      8) Access Point 9) NIC(Network Interface Card)	(½ M for each device)
	<b>g)</b>	<b>List any four application layer protocol.</b>	<b>2 M</b>
	<b>Ans</b>	1. Simple Mail Transfer Protocol (SMTP) 2. File Transfer Protocol (FTP) 3. Hyper Text Transfer Protocol (HTTP) 4. Trivial File Transfer Protocol (TFTP) 5. <b>TE</b> Letype <b>NE</b> Twork (TELNET) 6. Simple Network Management Protocol 7. Dynamic Host Configuration Protocol (DHCP)	Any 4 protocol (½ M for each application layer protocol)
<b>2.</b>		<b>Attempt any <u>THREE</u> of the following:</b>	<b>12 M</b>
	<b>a)</b>	<b>Explain the components of Data communication.</b>	<b>4 M</b>
	<b>Ans</b>	<p>A data communications system has five components:</p> <p>1) Message: The message is the information (data) to be communicated. Popular forms of information include text, numbers, pictures, audio, and video.</p> <p>2) Sender: The sender is the device that sends the data message. It can be a computer, workstation, telephone handset, video camera, and so on.</p> <p>3) Receiver: The receiver is the device that receives the message. It can be a computer, workstation, telephone handset, television, and so on.</p> <p>4) Transmission medium: The transmission medium is the physical path by which a message travels from sender to receiver. Some examples of transmission media include twisted-pair wire, coaxial cable, fiber-optic cable, and radio waves.</p> <p>5) Protocol: A protocol is a set of rules that govern data communications. It represents an agreement between the communicating devices. Without a protocol, two devices may be connected but not communicating.</p> <div data-bbox="370 1449 1166 1680"><p>The diagram illustrates the components of data communication. On the left is a box labeled 'Sender' and on the right is a box labeled 'Receiver'. Above the 'Sender' box is a vertical rectangle containing 'Rule 1:', 'Rule 2:', and 'Rule n:'. Above the 'Receiver' box is a vertical rectangle containing 'Rule 1:', 'Rule 2:', and 'Rule n:'. A horizontal line connects the 'Sender' and 'Receiver' boxes, with the word 'Medium' written below it. Above this line, there is a double vertical bar followed by an arrow pointing right, with the word 'Message' written below it. The word 'Protocol' is written to the right of the rule boxes on both the sender and receiver sides.</p></div>	1 M diagram 3 M explanation of components
	<b>b)</b>	<b>Describe Propagation modes in fibre optic cable.</b>	<b>4 M</b>
	<b>Ans</b>	<b>A) Multimode:</b>	2 M for Multimode with

Multimode is so named because multiple beams from a light source move through the core in different paths. How these beams move within the cable depends on the structure of the core.

Multimode having 2 types of modes:

- 1) Multimode step-index fiber
- 2) Multimode graded-index fiber

**In multimode step-index fiber**, the density of the core remains constant from the center to the edges.

The term step index refers to the suddenness of this change, which contributes to the distortion of the signal as it passes through the fiber. (refer fig a)

A second type of fiber, called **multimode graded-index fiber**, decreases this distortion of the signal through the cable. The word index here refers to the index of refraction. As we saw above, the index of refraction is related to density. (refer fig b)

### B) Single-Mode

Single-mode uses step-index fiber and a highly focused source of light that limits beams to a small range of angles, all close to the horizontal.

In this case, propagation of different beams is almost identical, and delays are negligible.

All the beams arrive at the destination "together" and can be recombined with little distortion to the signal. (refer fig c)

	d)	Describe the process of DHCP server configuration.		4 M														
Ans		A DHCP server (Dynamic Host Configuration Protocol) is a server that automatically assigns IP addresses to computers and other devices on the network. Without a DHCP server, each device on the network would need to be manually configured with an IP address.		Correct process of DHCP server configuration 4 M  (any relevant process can be considered)														
		<b>Process of DHCP server configuration</b>																
		<u>Step 1: Open Server Manager</u>																
		Click the start button then click the Server Manager																
		<u>Step 2: Add roles and features</u>																
		On the server manager dashboard click “Add roles and features” This will start the add roles and features wizard.																
		Click next on the before you begin page.																
		<u>Step 3: Select Role-based or feature-based installation</u>																
		Make sure “Role-based or feature-based installation is selected and click next																
		<u>Step 4: Select destination server</u>																
On this page, choose the server you want the DHCP service installed on.																		

#### Step 5: Select server roles

On this page, you want to select the DHCP server roles and click next.

When you select the roll you will get a pop up asking to add features that are required for DHCP server. Click add features

Back on the select server roles page click next

#### Step 6: Feature, DHCP Server

On the features, screen click next.

On the DHCP server click next.

#### Step 7: Confirmation

On the confirmation page, you can select to automatically restart the server if required.

On 2016 server, it does not require a restart.

### **Configure DHCP Server**

If you followed, the steps above you should now have the DHCP service installed.

But, It still needs to be configured.

#### Step 1: Server Manager

In the server manager dashboard, you will see a yellow notification at the top left.

Click on it

Now click on “Complete DHCP configuration”

#### Step 2: Post-Install configuration wizard

On the description screen click next

On the authorization page use AD credentials if the server is joined to the domain.

Choose “Skip AD authorization” if the DHCP server is standalone and not joined to the domain.

Click commit

You will see a summary page of the configuration steps

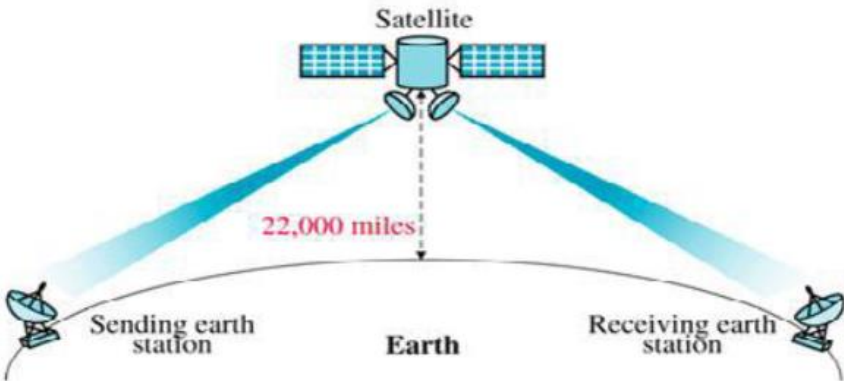

Click close

Now you can open the DHCP management console to configure DHCP scopes and other options.

To access the DHCP management console click start -> Windows Administrative Tool  
-> DHCP

The next steps are to configure a new scope, configure scope options and ensure clients can access the DHCP server.

3.		Attempt any <u>THREE</u> of the following:	12 M
	a)	Describe Satellite communication with neat diagram.	4 M
	Ans	<p><b>SATELLITE COMMUNICATION:</b></p> <p>In satellite communication, signal transferring between the sender and receiver is done with the help of satellite. In this process, the signal which is basically a beam of modulated microwaves is sent towards the satellite called UPLINK (6 Ghz). Then the satellite amplifies the signal and sent it back to the receiver's antenna present on the earth's surface called as DOWNLINK (4Ghz), as shown in the diagram given</p> <p style="text-align: center;"><b>Satellite Communication</b></p>  <p>As the entire signal transferring is happening in space. Thus this type of communication is known as space communication. The satellite does the functions of an antenna and the repeater together. If the earth along with its ground stations is revolving and the satellite is stationery, the sending and receiving earth stations and the satellite can be out of sync over time.</p> <p>Therefore Geosynchronous satellites are used which move at same RPM as that of the earth in the same direction.</p> <p>So the relative position of the ground station with respect to the satellite never changes.</p> <p>However 3 satellites are needed to cover earth's surface entirely.</p>	2 M Diagram and 2M Explanation

Frequency band used in satellite communication:

Band	Downlink	Uplink
C	3.7 to 4.2 Ghz	5.925 to 6.425Ghz
Ku	11.7 to 12.2 Ghz	14 to 14.5 Ghz
Ka	17.7 to 21 Ghz	27.5 to 31 Ghz

**Application of satellite:**

Satellite television  
digital cinema  
satellite radio  
satellite internet access

**b) Describe modes of communication.**

**4 M**

**Ans**

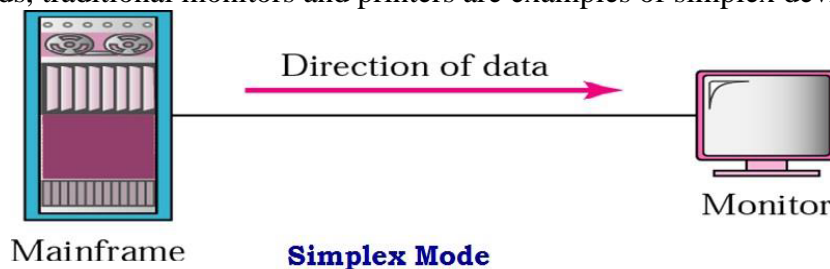

Transmission mode refers to the mechanism of transferring of data between two devices connected over a network. It is also called Communication Mode. These modes direct the direction of flow of information. There are three types of transmission modes.

They are:

- ☐ Simplex Mode
- ☐ Half duplex Mode
- ☐ Full duplex Mode

In Simplex mode, the communication is unidirectional, as on a one-way street. Only one of the two devices on a link can transmit; the other can only receive. The simplex mode can use the entire capacity of the channel to send data in one direction.

-Keyboards, traditional monitors and printers are examples of simplex devices.

In half-duplex mode, each station can both transmit and receive, but not at the same time. When one device is sending, the other can only receive, and vice versa. The half-duplex mode is used in cases where there is no need for

Modes of Communication-  
1 M, Diagram and  
Explanation-  
1 M each

communication in both directions at the same time. The entire capacity of the channel can be utilized for each direction  
-for example :Walkie-talkies.

In full-duplex mode both stations can transmit and receive data simultaneously. The transmission medium sharing can occur in two ways, namely, either the link must contain two physically separate transmission paths or the capacity of the channel is divided between signals traveling in both directions.

-One common example of full-duplex communication is the telephone network. When two people are communicating by a telephone line, both can talk and listen at the same time.

c) **Describe the working of Router with suitable diagram.**

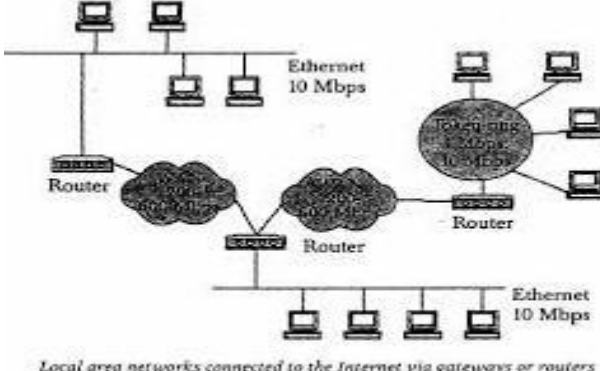

**4 M**

**Ans** Router is a device that connects 2 or more networks. It consist of hardware and software .hardware includes the physical interfaces to the various networks in the internetwork. Software in a router is OS and routing protocols management software.

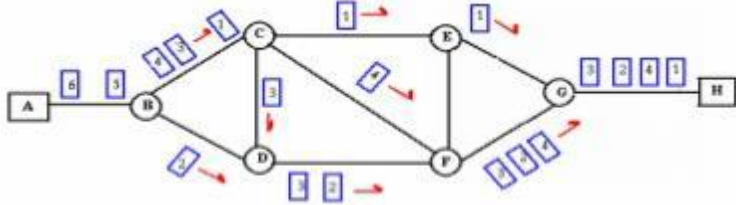

- 1) Router use logical and physical addressing to connect two or more logically separate networks.
- 2) They accomplish this connection by organizing the large network into logical network called subnets.
- 3) Each of the subnet is given a logical address. This allows the network to be separate but still access to each other and exchange data.
- 4) Data is grouped into packets. Each packet has physical device address and logical network address.

	c)	Describe the principles of packet switching techniques with neat diagram.	4 M												
	Ans	<p><b>Packet Switching:</b> The entire message is broken down into smaller chunks called packets. The switching information is added in the header of each packet and transmitted independently.</p> <p>It is easier for intermediate networking devices to store small size packets and they do not take much resource either on carrier path or in the internal memory of switches.</p>  <p>Packet switching enhances line efficiency as packets from multiple applications can be multiplexed over the carrier. The internet uses packet switching technique. Packet switching enables the user to differentiate data streams based on priorities. Packets are stored and forwarded according to their priority to provide quality of service.</p>	2 M diagram and 2 M explanation												
	d)	Describe OSI reference model with its Layered structure.	4 M												
	Ans	<p>OSI model (open system interconnection) model was developed by ISO (international standard organization)</p> <p><b>Function of OSI model:</b></p> <p>i. It provides way to understand how internetwork operates.</p>	2 M Diagram and 2 M Explanation												

ii. It gives guideline for creating network standard.  
OSI model has 7 layers as shown in the figure.

Application Layer
Presentation Layer
Session Layer
Transport Layer
Network Layer
Data link Layer
Physical Layer

OSI model has following 7 layers as Physical layer, data link layer, Network layer, Transport layer, session layer, presentation layer, application layer.

1. **Physical layer:** It co-ordinates the functions required to transmit bit stream over physical medium. It deals with mechanical and electrical specifications of interface and transmission medium. For transmission it defines procedures and functions that devices and transmission medium has to perform

Physical characteristics of interfaces and media.

Representation of bits: Data rate(transmission rate).

Synchronization of bits.

Line configuration: Point to point or multipoint configuration should be used.

2.**Data link layer:** It is responsible for transmitting group of bits between the adjacent nodes. The group of bits is called as frame. The network layer passes a data unit to the data link layer. Header and trailer is added to the data unit by data link layer. This data unit is passed to the physical layer. Data link layer is responsible for moving frames from one node to the next.

**Functions of data link layer are:**

- 1) Framing
- 2) Physical addressing
- 3) Flow control
- 4) Error control
- 5) Media access control
- 6) Node to node delivery

3. **Network layer:** It is responsible for routing the packets within the subnet i.e. from source to destination. It is responsible for source to destination delivery of individual packets across multiple networks. It ensures that packet is delivered from point of origin to destination.

**Functions of network layer:**

- 1) logical addressing
- 2) Routing.
- 3) Congestion control
- 4) Accounting and billing
- 5) Address transformation
- 6) Source host to destination host error free delivery of packet.

		<p>4. <b>Transport layer:</b> Responsibility of process to process delivery of message Ensure that whole message arrives in order.</p> <p><b>Functions of Transport layer:</b></p> <p>1) Service point addressing</p> <p>2) Segmentation and reassembly</p> <p>3) Connection control</p> <p>4) Flow control: Flow control is performed end to end</p> <p>5) Error control</p> <p>5. <b>Session layer:</b> Establishes, maintains, and synchronizes the interaction among communication systems It is responsible for dialog control and synchronization.</p> <p><b>Functionsof Session layer:</b></p> <p>1) Dialog control</p> <p>2) Synchronization, session and sub session</p> <p>3) Session closure</p> <p>6. <b>Presentation layer:</b> It is concerned with syntax, semantics of information exchanged between the two systems.</p> <p><b>Functions of Presentation layer:</b></p> <p>Translation: presentation layer is responsible for converting various formats into required format of the recipient</p> <p>Encryption: Data encryption and decryption is done by presentation layer for security.</p> <p>Compression and Decompression: data to be transform compressed while sending and decompress while receiving for reducing time of transmission.</p> <p>7. <b>Application layer:</b> It enables user to access the network. It provides user interfaces and support for services like email, remote file access.</p> <p><b>Functions of Application layer:</b></p> <p>Network virtual terminal</p> <p>file transfer access and management</p> <p>mail services and directory services</p>											
	e)	<p><b>The following bit stream is encoded with VRC, LRC and even parity. Blue White	Blue White
Orange	Orange
Brown White	Brown White
Brown	Brown

A straight-through cable is used to connect the following devices.

1. PC to Switch
2. PC to Hub
3. Router to Switch
4. Switch to Server
5. Hub to Server

#### **cross-over cable**

In this cable, transmitting pins of one side connect with the receiving pins of the other side.

The wire at pin 1 on one end of the cable connects to pin 3 at the other end of the cable. The wire at pin 2 connects to pin 6 on the other end of the cable. Remaining wires connect in the same positions at both ends.

The following table lists the wire positions of the cross-over cable on both side

Side A	Side B
Green White	Orange White
Green	Orange
Orange White	Green White
Blue	Blue
Blue White	Blue White
Orange	Green
Brown White	Brown White
Brown	Brown

The cross-over cable is used to connect the following devices.

1. Two computers
2. Two hubs
3. A hub to a switch
4. A cable modem to a router
5. Two router interfaces

c) **Compare IPv4 and IPv6. (Any six point each)**

**6 M**

**Ans**

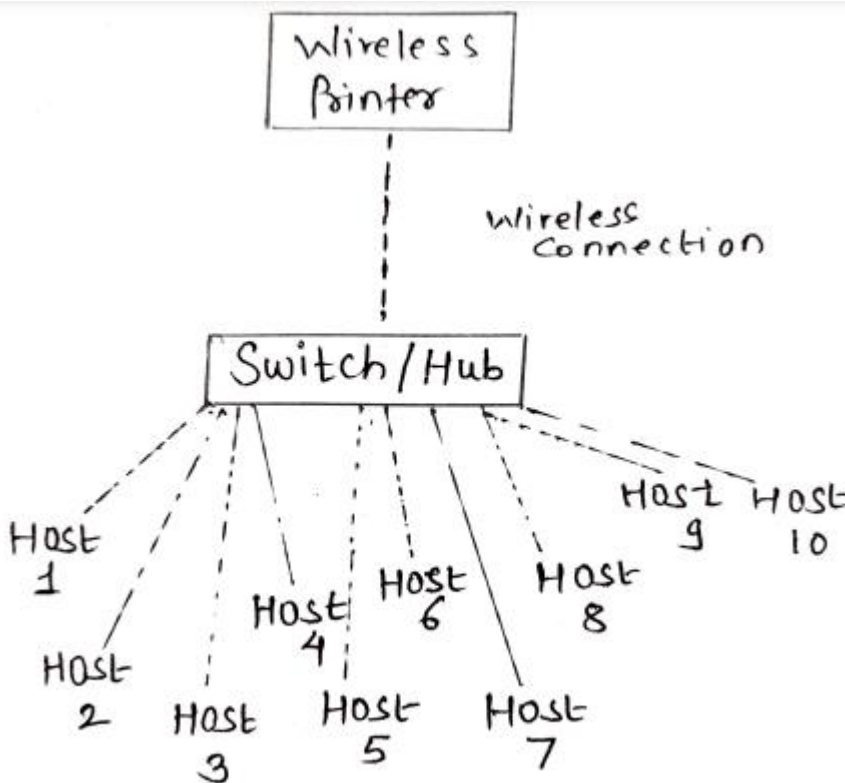

Any six points 6  
M

Basis for differences	IPv4	IPv6
Size of IP address	IPv4 is a 32-Bit IP Address.	IPv6 is 128 Bit IP Address.
Addressing method	IPv4 is a numeric address, and its binary bits are separated by a dot (.)	IPv6 is an alphanumeric address whose binary bits are separated by a colon (:). It also contains hexadecimal.
Number of header fields	12	8
Length of header filed	20	40
Checksum	Has checksum fields	Does not have checksum fields
Example	12.244.233.165	2001:0db8:0000:0000:0000:ff00:0042:7879
Type of Addresses	Unicast, broadcast, and multicast.	Unicast, multicast, and anycast.
Number of classes	IPv4 offers five different classes of IP Address. Class A to E.	IPv6 allows storing an unlimited number of IP Address.
VLSM support	IPv4 support VLSM (Variable Length Subnet mask).	IPv6 does not offer support for VLSM.
Network Configuration	Networks need to be configured either manually or with DHCP.	IPv6 support auto configuration capabilities.
SNMP	SNMP is a protocol used for system	SNMP does not support IPv6.

		management.		
		Packet size	Packet size 576 bytes required, fragmentation optional	1208 bytes required without fragmentation
6.		Attempt any <u>TWO</u> of the following:		12 M
	a)	Calculate CRC for the frame 110101011 and generator Polynomial $X^4 + X + 1$ and write the transmitted frame.		6 M
	Ans	<p>• Given frame for transmission is = 110101011</p> <p>• Generator Polynomial is <math>x^4 + x + 1</math></p> <p><math>= x^4 \cdot 1 + x^3 \cdot 0 + x^2 \cdot 0 + x^1 \cdot 1 + x^0 \cdot 1 = 10011</math></p> <p>• Append 4 zeros to the frame:</p> <p>1101010110000</p> <pre> 110000011 10011) 1101010110000       10011       ---       10011       ---       00000       00000       ---       00001       00000       ---       00011       00000       ---       00110       00000       ---       01100       00000       ---       11000       10011       ---       10110       10011       ---       0101 </pre> <p>• Transmitted value is : <u>1101010110101</u></p>		<p>Identifying generator Polynomial = 1 M</p> <p>Calculating CRC for the frame 110101011 = 4 M</p> <p>Identifying the transmitted frame = 1 M</p>

The minimum header size is 20 bytes.	
OSI Model	TCP/IP Model																						
OSI model provides a clear distinction between interfaces, services, and protocols.	TCP/IP doesn't have any clear distinguishing points between services, interfaces, and protocols.																						
OSI refers to Open Systems Interconnection.	TCP refers to Transmission Control Protocol.																						
OSI uses the network layer to define routing standards and protocols.	TCP/IP uses only the Internet layer.																						
OSI follows a vertical approach.	TCP/IP follows a horizontal approach.																						
OSI layers have seven layers.	TCP/IP has four layers.																						
In the OSI model, the transport layer is only connection-oriented.	A layer of the TCP/IP model is both connection-oriented and connectionless.																						
In the OSI model, the data link layer and physical are separate layers.	In TCP, physical and data link are both combined as a single host-to-network layer.																						
Session and presentation layers are a part of the OSI model.	There is no session and presentation layer in the TCP model.																						
The minimum size of the OSI header is 5 bytes.	The minimum header size is 20 bytes.																						
	c)	Draw suitable network layout with star topology for a computer lab with 10 hosts and a wireless printers. List all components in the Layout.	6 M																				
	Ans	<div><p>Fig: layout with star topology for a computer lab with 10 hosts</p></div>	layout with star topology 4 M  List all components in the layout 2 M

**MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION**  
(Autonomous)  
(ISO/IEC - 27001 - 2005 Certified)

**WINTER – 2022 EXAMINATION**  
**MODEL ANSWER**

**Subject: Data Communication & Computer Network      Subject Code:**

**22414**

**Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.
- 8) As per the policy decision of Maharashtra State Government, teaching in English/Marathi and Bilingual (English + Marathi) medium is introduced at first year of AICTE diploma Programme from academic year 2021-2022. Hence if the students in first year (first and second semesters) write answers in Marathi or bilingual language (English + Marathi), the Examiner shall consider the same and assess the answer based on matching of concepts with model answer.

WINTER – 2022 EXAMINATION  
MODEL ANSWER

Subject: Data Communication & Computer Network Subject Code:

22414

- A device can only send the data but cannot receive it or it can receive the data but cannot send the data.
- The radio station is a simplex channel as it transmits the signal to the listeners but never allows them to transmit back.
- Keyboard and Monitor are the examples of the simplex mode as a keyboard can only accept the data from the user and monitor can only be used to display the data on the screen.

**Fig: Transmission modes**

**Half-duplex mode**

- In a Half-duplex channel, direction can be reversed, i.e., the station can transmit and receive the data as well.
- Messages flow in both the directions, but not at the same time.
- The entire bandwidth of the communication channel is utilized in one direction at a time.
- In half-duplex mode, it is possible to perform the error detection, and if any error occurs, then the receiver requests the sender to retransmit the data.

<b>d) Ans.</b>	<p><b>State the OSI models Layer and give its functions.</b></p> <p><b>Physical Layer of OSI Model</b> The physical layer coordinates the functions required to carry a bit stream over a physical medium. It deals with the mechanical and electrical specifications of the interface and transmission medium. It also defines the procedures and functions that physical devices and interfaces have to perform for transmission to Occur.</p> <p><b>Data Link Layer of OSI Model</b> The data link layer transforms the physical layer, a raw transmission facility, to a reliable link. It makes the physical layer appear error-free to the upper layer (network layer).</p> <p><b>Network Layer of OSI Model</b> The network layer is responsible for the source-to-destination delivery of a packet, possibly across multiple networks (links). Whereas the data link layer oversees the delivery of the packet between two systems on the same network (links), the network layer ensures that each packet gets from its point of origin to its final destination.</p> <p><b>Transport Layer of OSI Model</b> The transport layer is responsible for process-to-process delivery of the entire message. A process is an application program running on a host. Whereas the network layer oversees source-to-destination delivery of individual packets, it does not recognize any relationship between those packets. It treats each one independently, as though each piece belonged to a separate message, whether or not it does. The transport layer, on the other hand, ensures that the whole message arrives intact and in order, overseeing both error control and flow control at the source-to-destination level.</p> <p><b>Session Layer of OSI Model</b> The services provided by the first three layers (physical, data link, and network) are not sufficient for some processes. The session layer is the network dialog controller. It establishes, maintains, and synchronizes the interaction among communicating systems</p>	<p><b>4M</b></p> <p><i>Listing 1M</i></p> <p><i>All layer function 3M</i></p>

WINTER – 2022 EXAMINATION  
MODEL ANSWER

Subject: Data Communication & Computer Network Subject Code:

22414

A piconet can have only one primary station. The communication between the primary and the secondary can be one-to-one or one-to-many. Figure shows a piconet.

Although a piconet can have a maximum of seven secondaries, an additional eight secondaries can be in the parked state. A secondary in a parked state is synchronized with the primary, but cannot take part in communication until it is moved from the parked state. Because only eight stations can be active in a piconet, activating a station from the parked state means that an active station must go to the parked state.

Piconet

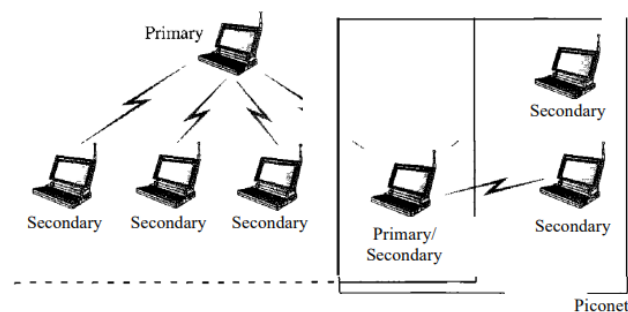

**Scatternet**

Piconets can be combined to form what is called a scatternet. A secondary station in one piconet can be the primary in another piconet. This station can receive messages from the primary in the first piconet (as a secondary) and, acting as a primary, deliver them to secondaries in the second piconet. A station can be a member of two piconets.

Figure illustrates a scatternet.

**22414**

	<p>In the above diagram, there are two Subnets. Note: It is a class C IP so, there are 24 bits in the network id part and 8 bits in the host id part.</p> <p>Subnetting for a network should be done in such a way that it does not affect the network bits. In class C the first 3 octets are network bits so it remains as it is.</p> <p><b>ii) Supernetting</b></p> <p>Supernetting is the procedure to combine the small networks into larger space. In subnetting, Network addresses's bits are increased. Supernetting is implemented via Classless interdomain routing.</p> <p><b>Example:</b> Suppose we have four small networks with network ID as <b>201.1.0.0, 201.1.1.0, 201.1.2.0, 201.1.3.0</b>.</p> <p>The ability to aggregate these networks can be assessed based on the following</p> <ol style="list-style-type: none"><li>1. <b>Contiguous:</b> As we can see that all the four networks are Class C networks. The range of the first network is from 201.1.0.0 to 201.1.0.255. The range of the second network start from 201.1.1.0. If we add 1 to the last IP address of the first network we get the starting IP address of the second network. Similarly, we can check that all the networks are contiguous.</li><li>2. <b>Same Size:</b> All the networks are of class C.</li><li>3. <b>Divisibility:</b> The first IP address should be divisible by the total size of the networks.</li></ol> <p><i>First IP address binary representation:</i></p> <p style="text-align: center;"><i>11001001.00000001.000000 00.00000000</i></p> <p>The last 10 bits are zero. Hence it divisible by the size of the network. Hence, all three conditions are satisfied.</p> <p>These four networks can be combined to form a supernet. The <b>supernet ID or the network ID</b> for all the four networks will be <b>201.1.0.0</b> .</p>

**Subject: Data Communication & Computer Network      Subject Code:**

**22414**

		<p>3. Configure and start the intend daemon on each host machine on the network. Read TCP/IP daemons and then follow the instructions in Configuring the intend daemon.</p> <p>4. Configure each host machine to perform either local name resolution or to use a name server. If a hierarchical Domain Name network is being set up, configure at least one host to function as a name server.</p> <p>5. If the network needs to communicate with any remote networks, configure at least one host to function as a gateway. The gateway can use static routes or a routing daemon to perform inters network routing.</p> <p>6. Decide which services each host machine on the network are to be used. By default, all services are available. Follow the instructions in Client network services to make a particular service unavailable.</p> <p>7. Decide which hosts on the network will be servers, and which services a particular server will provide. Follow the instructions in Server network services to start the server daemons to be run.</p> <p>8. Configure any remote print servers that are needed.</p>	
	<p><b>c)</b> <b>Ans.</b></p>	<p><b>Explain with the neat sketch the working of Router and switch Router:</b></p> <ul style="list-style-type: none"><li>• It operates at the network layer.</li><li>• A router normally connects LANs and WANs in the Internet and has a routing table that is used for making decisions about the route. The routing tables are normally dynamic and are updated using routing protocols.</li><li>• Routers are devices that help in determining the best path out of the available paths, for a particular transmission. They consist of a combination of hardware and software.</li><li>• The two main kinds of software in a router are the operating system and the routing protocol.</li><li>• Routers use logical and physical addressing to connect two or more logically separate networks.</li><li>• Messages are stored in the routers before re-transmission, routers are said to implement a store-and-forward technique.</li></ul>	<p style="text-align: center;"><b>6M</b></p> <p style="text-align: right;"><i>Diagram Of router 1M Explanation 2M</i></p> <p style="text-align: right;"><i>Diagram Of switch 1M Explanation 2M</i></p>

MODEL ANSWER

Subject: Data Communication & Computer Network Subject Code:

22414

Fig: Router

**Switch :**

Switch is used to connect the multiple devices together in a LAN segment.

Switches are network devices used to connect multiple computers in which it can direct a transmission to its specific destination. (Unicast the signals).

There are two types of switches namely, Layer-2 and Layer-3 switches. They can be used to connect single or multiple networks.

Layer 2 Switches operate in the data link layer (layer 2) using the MAC addresses.

Layer 3 Switches operate in the network layer (layer 3) using the IP address
